24 MHz Cortex-M0+ Based Microcontroller

Higher integration receiver controller MCU for wireless power transfer application. Targeting battery powered products are smart phone, tablet, portable medical devices, power tools etc.

This product offers:

- AC/DC conversion and modulation/demodulation circuit for bi-directional communication to support industrial standards with foreign object detection (FOD)
- USB/adapter power switcher to charge products with wire and wireless with priority.
- Up to 15 W with proper external transistors
- QFN package for industrial application and WLCSP package for space constrained consumer applications

## Performance

- 24 MHz ARM® Cortex®-M0+ core
- Single cycle 32-bit x 32-bit multiplier

## Memories and memory interfaces

- 16 KB program flash memory
- 4 KB SRAM

## System peripherals

- LDO provides 5 V and 3 A output to down system
- CNC controls the communication and provides AC protection
- High voltage input PMC module with three power modes: Run, Wait, Stop
- LVR with reset or interrupt, selectable trip points
- WDOG with independent clock source
- Serial wire debug interface

## Clocks

- 32.768 kHz or 4 MHz to 24 MHz crystal oscillator
- Internal 20 kHz low-power oscillator (LPO)
- Internal clock source (ICS)
- Internal FLL with internal or external reference, precision trimming

## Operating Characteristics

- Input from rectifier voltage range: 3.5 to 20 V
- Temperature range (ambient): -40 to 85°C

## Human-machine interface

- One interrupt module (IRQ)
- Up to 13 general-purpose input/output (GPIO)

## Communication interfaces

- One UART module
- One I2C module

## Analog Modules

- One 12-bit analog-to-digital converters (ADC) with up to 4 external channels
- One programmable gain amplifier (PGA) with differential input and output
- One analog comparator (ACMP) containing a 6-bit DAC and programmable reference input

## Timers

- Two 2-channel FTMs with basic TPM function
- One periodic interrupt timers (PIT)
- One FSK demodulation timer (FSKDT)
- System tick timer (SysTick)
- One real time clock (RTC)

## Security and integrity modules

- 80-bit unique identification number per chip

## 1.4 Voltage and current operating ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maximum is not guaranteed. Stress beyond the limits specified in the following table may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this document.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either  $V_{SS}$  or  $V_{DD}$ ) or the programmable pullup resistor associated with the pin is enabled.

**Table 1. Voltage and current operating ratings**

Symbol	Description	Min.	Max.	Unit
$V_{REC}$	Supply voltage from wireless receiver rectifier	0	20	V
$V_{AC1/AC2}$	AC voltage input from wireless receiver coil	-0.3	21	V
$I_{VREC}$	Maximum current into $V_{REC}$	0	120	mA
$V_{DIO}$	Digital input voltage (except $\overline{RESET\_b}$ , EXTAL, and XTAL)	-0.3	$V_{DD}+0.3$	V
$V_{AD\_IN}$	Wired power input voltage	0	12

**Table 2. DC characteristics (continued)**

Symbol	Descriptions			Min.	Typical <sup>1</sup>	Max.	Unit
R <sub>PU</sub>	Pullup resistors	All digital inputs, when enabled (all I/O pins other than PTA6 or PTA7)	—	30.0	—	50.0	kΩ
R <sub>PU</sub> <sup>2</sup>	Pullup resistors	PTA6 and PTA7	—	30.0	—	60.0	kΩ
I <sub>IC</sub>	DC injection current <sup>3, 4, 5, 6</sup>	Single pin limit	V <sub>IN</sub> < V <sub>SS</sub> , V <sub>IN</sub> > V <sub>DD</sub>	-0.2	—	2	mA
		Total MCU limit, includes sum of all stressed pins		-5	—	25	
C <sub>In</sub>	Input capacitance, all pins		—	—	—	7	pF
V <sub>RAM</sub>	RAM retention voltage		—	2.0	—	—	V

1. Typical values are measured at 25 °C. Characterized, not tested.
2. The specified resistor value is the actual value internal to the device. The pullup value may appear higher when measured externally on the pin.
3. This item applies to the GPIO share pads only.
4. All functional non-supply pins, except for PTA6 and PTA7, are internally clamped to V<sub>DD</sub>.
5. Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the large one.
6. Power supply must maintain regulation within operating V<sub>DD</sub> range during instantaneous and operating maximum current conditions. If the positive injection current (V<sub>In</sub> > V<sub>DD</sub>) is higher than I<sub>DD</sub>, the injection current may flow out of V<sub>DD</sub> and could result in external power supply going out of regulation. Ensure that external V<sub>DD</sub> load will shunt current higher than maximum injection current when the MCU is not consuming power, such as no system clock is present, or clock rate is very low (which would reduce overall power consumption).

## 2.1.3 EMC performance

Electromagnetic compatibility (EMC) performance is highly dependent on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation play a significant role in EMC performance. The system designer must consult the following Freescale applications notes, available on [freescale.com](http://freescale.com) for advice and guidance specifically targeted at optimizing EMC performance.

- AN2321: Designing for Board Level Electromagnetic Compatibility
- AN1050: Designing for Electromagnetic Compatibility (EMC) with HCMOS Microcontrollers
- AN1263: Designing for Electromagnetic Compatibility with Single-Chip Microcontrollers
- AN2764: Improving the Transient Immunity Performance of Microcontroller-Based Applications

V <sub>RE4</sub>	Radiated emissions voltage, band 4	500–1000	5	dBµV	
V <sub>RE_IEC</sub>	IEC level	0.15–1000	M	—	

1. Determined according to IEC Standard 61967-1, *Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 1: General Conditions and Definitions* and IEC Standard 61967-2, *Integrated Circuits - Measurement of Electromagnetic Emissions, 150 kHz to 1 GHz Part 2: Measurement of Radiated Emissions – TEM Cell and Wideband TEM Cell Method*. Measurements were made while the microcontroller was running basic application code. The reported emission level is the value of the maximum measured emission, rounded up to the next whole number, from among the measured orientations in each frequency range.
2.  $V_{RECT} = 5.0 \text{ V}$ ,  $T_A = 25^\circ\text{C}$ ,  $f_{osc} = 32.768 \text{ kHz}$  (crystal),  $f_{SYS} = 24 \text{ MHz}$ ,  $f_{BUS} = 24 \text{ MHz}$
3. Specified according to Annex D of IEC Standard 61967-2, *Measurement of Radiated Emissions – TEM Cell and Wideband TEM Cell Method*

$T_J$	Die junction temperature	-40	95	°C	
$T_A$	Ambient temperature	-40	85	°C	<sup>1</sup>

1. Maximum  $T_A$  can be exceeded only if the user ensures that  $T_J$  does not exceed the maximum. The simplest method to determine  $T_J$  is:  $T_J = T_A + \theta_{JA} \times \text{chip power dissipation}$ .

**Table 9. Thermal operating requirements of QFN package**

Symbol	Description	Min.	Max	Unit	Notes
T <sub>J</sub>	Die junction temperature	-40	105	°C	
T <sub>A</sub>	Ambient temperature	-40	85	°C	1

1. Maximum T<sub>A</sub> can be exceeded only if the user ensures that T<sub>J</sub> does not exceed the maximum. The simplest method to determine T<sub>J</sub> is: T<sub>J</sub> = T<sub>A</sub> + θ<sub>JA</sub> × chip power dissipation.

### 2.3.2 Thermal characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take P<sub>I/O</sub> into account in power calculations, determine the difference between actual pin voltage and V<sub>SS</sub> or V<sub>DD</sub> and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and V<sub>SS</sub> or V<sub>DD</sub> will be very small.

**Table 10. Thermal Attributes**

Board type	Symbol	Description	32 QFN	36 WLCSP	Unit	Notes
Single-layer (1S)	R <sub>θJA</sub>	Thermal resistance, junction to ambient (natural convection)	97	129.8	°C/W	1, 2
Four-layer (2s2p)	R <sub>θJA</sub>	Thermal resistance, junction to ambient (natural convection)	33	71.4	°C/W	1, 3
Single-layer (1S)	R <sub>θJMA</sub>	Thermal resistance, junction to ambient (200 ft./min. air speed)	81	116.5	°C/W	1, 3
Four-layer (2s2p)	R <sub>θJMA</sub>	Thermal resistance, junction to ambient (200 ft./min. air speed)	27	68.0	°C/W	1, 3
—	R <sub>θJB</sub>	Thermal resistance, junction to board	12	48.6	°C/W	4
—	R <sub>θJC</sub>	Thermal resistance, junction to case	1.3	8.1	°C/W	5
—	Ψ <sub>JT</sub>	Thermal characterization parameter, junction to package top outside center (natural convection)	3	0.2	°C/W	6
—	Ψ <sub>JB</sub>	Thermal characterization parameter, junction to package bottom outside center (natural convection)	—	14.3	°C/W	7

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

2. JESD51-2 with the single layer board (JESD51-3) horizontal.
3. Per JEDEC JESD51-6 with the board (JESD51-7) horizontal.
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the solder pad on the bottom of the package. Interface resistance is ignored.
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.
7. Thermal characterization parameter indicating the temperature difference between package bottom center and the junction temperature per JEDEC JESD51-12. When Greek letters are not available, the thermal characterization parameter is written as Psi-JB.

The average chip-junction temperature ( $T_J$ ) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA})$$

Where:

$T_A$  = Ambient temperature, °C

$\theta_{JA}$  = Package thermal resistance, junction-to-ambient, °C/W

$$P_D = P_{INT} + P_{I/O}$$

$P_{INT} = I_{DD} \times V_{DD}$ , Watts - chip internal power

$P_{I/O}$  = Power dissipation on input and output pins - user determined

For most applications,  $P_{I/O} \ll P_{INT}$  and can be neglected. An approximate relationship between  $P_D$  and  $T_J$  (if  $P_{I/O}$  is neglected) is:

$$P_D = K \div (T_J + 273 \text{ °C})$$

Solving the equations above for K gives:

$$K = P_D \times (T_A + 273 \text{ °C}) + \theta_{JA} \times (P_D)^2$$

Where K is a constant pertaining to the particular part. K can be determined by measuring  $P_D$  (at equilibrium) for an known  $T_A$ . Using this value of K, the values of  $P_D$  and  $T_J$  can be obtained by solving the above equations iteratively for any value of  $T_A$ .

### 3 Peripheral operating requirements and behaviors

#### 3.1 UHV modules

### 3.1.1 LDO electrical characteristics

This section provides data about the LDO module electrical characteristics.

**Table 11. LDO electrical characteristics**

Symbol	Description		Min.	Typical	Max.	Unit
$V_{OUT_1}$	Regulated output voltage		4.2	5	5.2	V

1.  $V_{OUT}$  is configurable by LDO\_VTRM[VTRM], it must be lower than 5.2 V. User can check the voltage dropout of MOSFET to avoid over power consumption.
2. This value is affected by the precision of the output voltage divider resistor.
3. N is configured by LDO\_VTRM[VTRM].

### 3.1.2 Programmable gain amplifier (PGA) electronic characterizations

This section includes information about PGA.

**Table 12. PGA electrical characteristics ( $4.5 \text{ V} \leq \text{VDDA} \leq 5.5 \text{ V}$ )**

Long term jitter of DCO output clock (averaged over 2 ms interval) <sup>7</sup>	$C_{\text{jitter}}$	—	0.02	0.2	% $f_{\text{dco}}$

1. Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
2. See crystal or resonator manufacturer's recommendation.
3. Load capacitors ( $C_1, C_2$ ), feedback resistor ( $R_F$ ) and series resistor ( $R_S$ ) are incorporated internally when RANGE = HGO = 0.
4. This parameter is characterized and not tested on each device.
5. Proper PC board layout procedures must be followed to achieve specifications.
6. This specification applies to any time the FLL reference source or reference divider is changed, trim value changed, or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
7. Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{\text{Bus}}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via  $V_{\text{DD}}$  and  $V_{\text{SS}}$  and variation in crystal oscillator frequency increase the  $C_{\text{jitter}}$  percentage for a given interval.

### 3.5.2 ADC characteristics

This section describes the ADC characteristics.

**Table 19. ADC Operating Conditions**

Characteristic	Symbol	Min	Typ	Max	Unit
Reference potential	$V_{RL}$	$V_{SSA}$	—	$V_{DDA} / 2$	V
	$V_{RH}$	$V_{DDA} / 2$	—	$V_{DDA}$	V
Differential reference voltage <sup>1</sup>	$V_{RH} - V_{RL}$	3.13	5.0	5.5	V
ADC Clock Frequency (derived from bus clock via the prescaler bus)	$f_{ATDCLK}$	0.25	—	8.33	MHz
Buffer amplifier turn on time (delay after module start / recovery from Stop mode)	$t_{REC}$	—	—	1	μs
ADC disable time	$t_{DISABLE}$	—	—	3	bus clock cycles
ADC Conversion Period <sup>2</sup>	12-bit resolution	$N_{CONV12}$	19	—	39
	10-bit resolution	$N_{CONV10}$	18	—	38
	8-bit resolution	$N_{CONV8}$	16	—	36

1. Full accuracy is not guaranteed when differential voltage is less than 4.50 V.
2. The minimum time assumes a sample time of four ATD clock cycles. The maximum time assumes a sample time of 24 ATD clock cycles.

**Table 21. ADC Conversion Performance (continued)**

Characteristic <sup>1</sup>	Symbol	Min	Typical	Max	Unit
Resolution	8-Bit	LSB	—	20	—
Differential Non-linearity	8-Bit	DNL	-0.5	$\pm 0.3$	0.5 counts
Integral Non-linearity	8-Bit	INL	-1	$\pm 0.5$	1 counts
Absolute Error <sup>2</sup>	8-Bit	AE	-1.5	$\pm 1$	1.5 counts

1. The 8-bit and 10-bit mode operation is structurally tested in production test. Absolute values are tested in 12-bit mode.  
 2. These values include the quantization error which is inherently 1/2 count for any ADC.

### NOTE

Supply voltage  $V_{DDA} = 5.12$  V. External  $V_{REF} = V_{RH} - V_{RL} = 5.12$  V.  $f_{ADCCLK} = 8.0$  MHz The values are tested to be valid with no IO PORT output drivers switching simultaneous with conversions.

### 3.5.3 Analog comparator (ACMP) electricals

**Table 22. Comparator electrical specifications**

Characteristic	Symbol	Min	Typical	Max	Unit
Supply current (Operation mode)	$I_{DDA}$	—	10	20	$\mu A$
Supply current, low-speed mode (EN = 1, PMODE = 0)	$I_{DDLS}$	—	18	20	$\mu A$
Analog input voltage	$V_{AIN}$	$V_{SS} - 0.3$	—	$V_{DDA}$	V
Analog input offset voltage	$V_{AIO}$	—	—	40	mV
Analog comparator hysteresis (HYST=0)	$V_H$	—	15	20	mV
Analog comparator hysteresis (HYST=1)	$V_H$	—	20	30	mV
Analog comparator initialization delay <sup>1</sup>		—	—	40	$\mu s$
Supply current (Off mode)	$I_{DDAOFF}$	—	60	—	nA
6-bit DAC current adder (enabled)	$I_{DAC6b}$	—	7	—	$\mu A$
Propagation Delay	$t_D$	—	0.4	1	$\mu s$

1. Fast mode is fully supported on all pins at VDD > 2.7 V. If VDD < 2.7 V, only pins that support high drive strength can support fast mode with maximum bus loading.
2. The maximum SCL Clock Frequency in Fast mode with maximum bus loading can only be achieved when using the High drive pins (see [Voltage and current operating behaviors](#)) or when using the Normal drive pins and VDD ≥ 2.7 V
3. The master mode I<sup>2</sup>C deasserts ACK of an address byte simultaneously with the falling edge of SCL. If no slaves acknowledge this address byte, then a negative hold time can result, depending on the edge rates of the SDA and SCL lines.
4. The maximum t<sub>HD</sub>; DAT must be met only if the device does not stretch the LOW period (t<sub>LOW</sub>) of the SCL signal.
5. Input Signal Slew = 10 ns and Output Load = 50 pF
6. Set-up time in slave-transmitter mode is 1 IPBus clock period, if the TX FIFO is empty.
7. A Fast mode I<sup>2</sup>C bus device can be used in a Standard mode I<sup>2</sup>C bus system, but the requirement t<sub>SU</sub>; DAT ≥ 250 ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, then it must output the next data bit to the SDA line t<sub>rmax</sub> + t<sub>SU</sub>; DAT = 1000 + 250 = 1250 ns (according to the Standard mode I<sup>2</sup>C bus specification) before the SCL line is released.
8. C<sub>b</sub> = total capacitance of the one bus line in pF.

## 4 Dimensions

### 4.1 Obtaining package dimensions

Package dimensions are provided in package drawings.

To find a package drawing, go to [freescale.com](http://freescale.com) and perform a keyword search for the drawing's document number:

If you want the drawing for this package	Then use this document number
32-pin QFN	98ASA00615D
36-pin WLCSP	98ASA00789D

## 5 Pinout

### 5.1 Signal multiplexing and pin assignments

The following table shows the signals available on each pin and the locations of these pins on the devices supported by this document.

#### NOTE

VDD1 and VDD2 must be short on PCB.

PTA6 and PTA7 are true open drain pins. The external pullup resistor must be added to make them output correct values in using I2C0, GPIO, and UART0.

The NC pin must be floating, and do not tie it to the any of the VDD or VSS.

## 6 Ordering Parts

### 6.1 Determining valid orderable parts

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to [freescale.com](http://freescale.com) and perform a part number search for the following device numbers: WPR1516.

## 7 Part Identification

### 7.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

### 7.2 Format

Part numbers for this device have the following format:

Q WPR## FFF R T PP N

## 7.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

Field	Description	Values
Q	Qualification status	<ul style="list-style-type: none"> <li>• M = Fully qualified, general market flow</li> <li>• P = Prequalification</li> </ul>
WPR##	WPR family	• WPR15
FFF	Program flash memory size	• 16 = 16 KB
R	Silicon revision	<ul style="list-style-type: none"> <li>• (Blank) = Main</li> <li>• A = Revision after main</li> </ul>
T	Temperature range (°C)	• C = -40 to 85 °C
PP	Package identifier	<ul style="list-style-type: none"> <li>• FM=32 QFN (5 mm x 5 mm)</li> <li>• AL=36 WLCSP (3.1 mm x 3.0 mm)</li> </ul>
N	Packaging type	<ul style="list-style-type: none"> <li>• R = Tape and reel</li> <li>• (Blank) = Trays</li> </ul>

## 8 Terminology and guidelines

### 8.1 Definition: Operating requirement

An *operating requirement* is a specified value or range of values for a technical characteristic that you must guarantee during operation to avoid incorrect operation and possibly decreasing the useful life of the chip.

#### 8.1.1 Example

This is an example of an operating requirement:

Symbol	Description	Min.	Max.	Unit
V <sub>DD</sub>	1.0 V core supply voltage	0.9	1.1	V

## 8.2 Definition: Operating behavior

Unless otherwise specified, an *operating behavior* is a specified value or range of values for a technical characteristic that are guaranteed during operation if you meet the operating requirements and any other specified conditions.

### 8.2.1 Example

This is an example of an operating behavior:

Symbol	Description	Min.	Max.	Unit
I <sub>WP</sub>	Digital I/O weak pullup/pulldown current	10	130	µA

## 8.3 Definition: Attribute

An *attribute* is a specified value or range of values for a technical characteristic that are guaranteed, regardless of whether you meet the operating requirements.

### 8.3.1 Example

This is an example of an attribute:

Symbol	Description	Min.	Max.	Unit
CIN_D	Input capacitance: digital pins	—	7	pF

## 8.4 Definition: Rating

A *rating* is a minimum or maximum value of a technical characteristic that, if exceeded, may cause permanent chip failure:

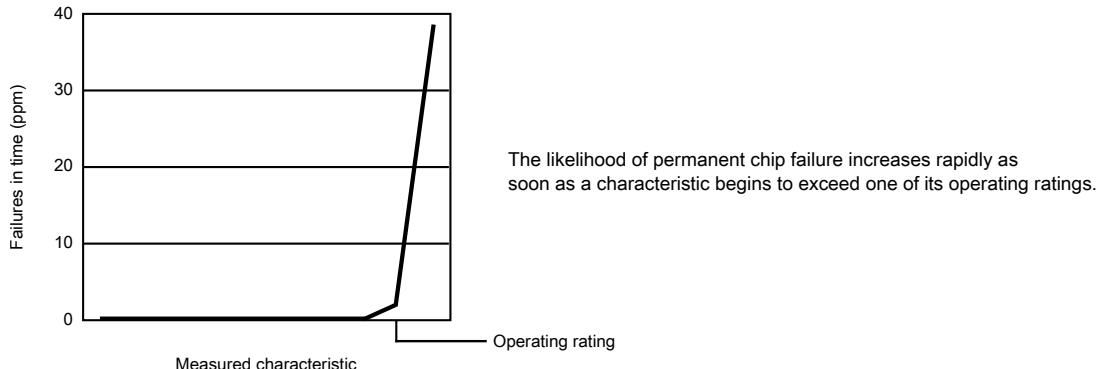

- *Operating ratings* apply during operation of the chip.
- *Handling ratings* apply when the chip is not powered.

### 8.4.1 Example

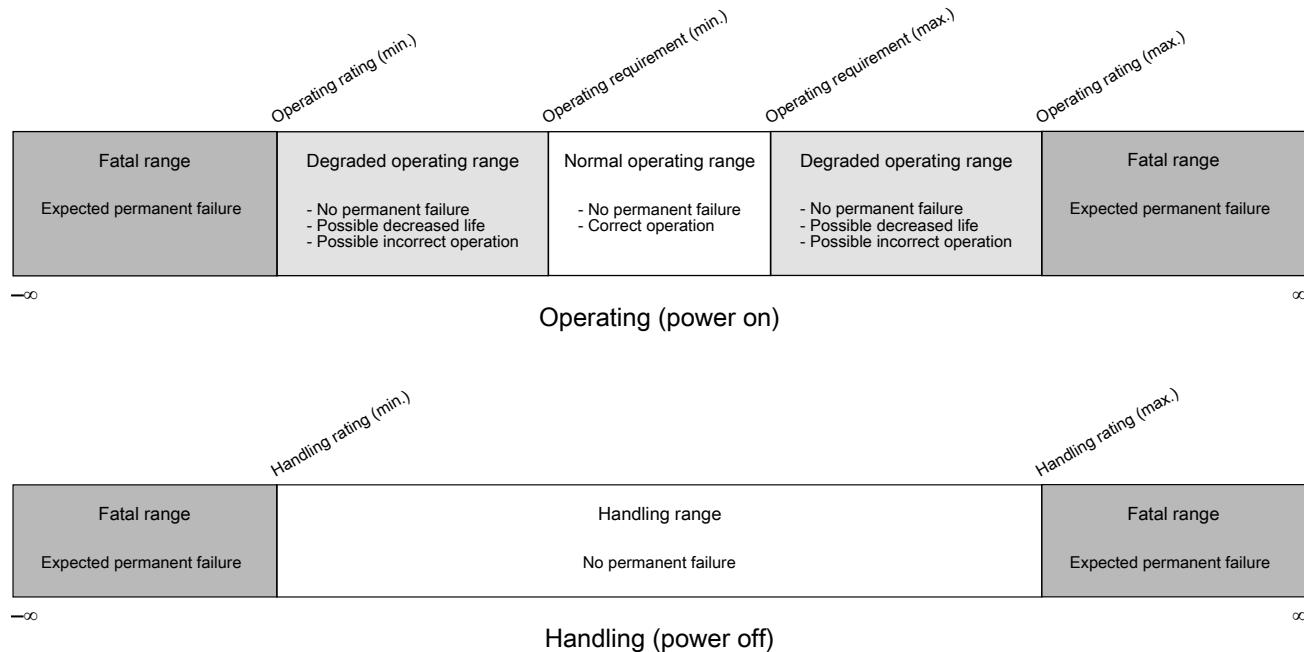

This is an example of an operating rating:

Symbol	Description	Min.	Max.	Unit
V <sub>DD</sub>	1.0 V core supply voltage	-0.3	1.2	V

## 8.5 Result of exceeding a rating

## 8.6 Relationship between ratings and operating requirements

## 8.7 Guidelines for ratings and operating requirements

Follow these guidelines for ratings and operating requirements:

- Never exceed any of the chip's ratings.
- During normal operation, don't exceed any of the chip's operating requirements.
- If you must exceed an operating requirement at times other than during normal operation (for example, during power sequencing), limit the duration as much as possible.

## 8.8 Definition: Typical value

A *typical value* is a specified value for a technical characteristic that:

- Lies within the range of values specified by the operating behavior
- Given the typical manufacturing process, is representative of that characteristic during operation when you meet the typical-value conditions or other specified conditions

Typical values are provided as design guidelines and are neither tested nor guaranteed.

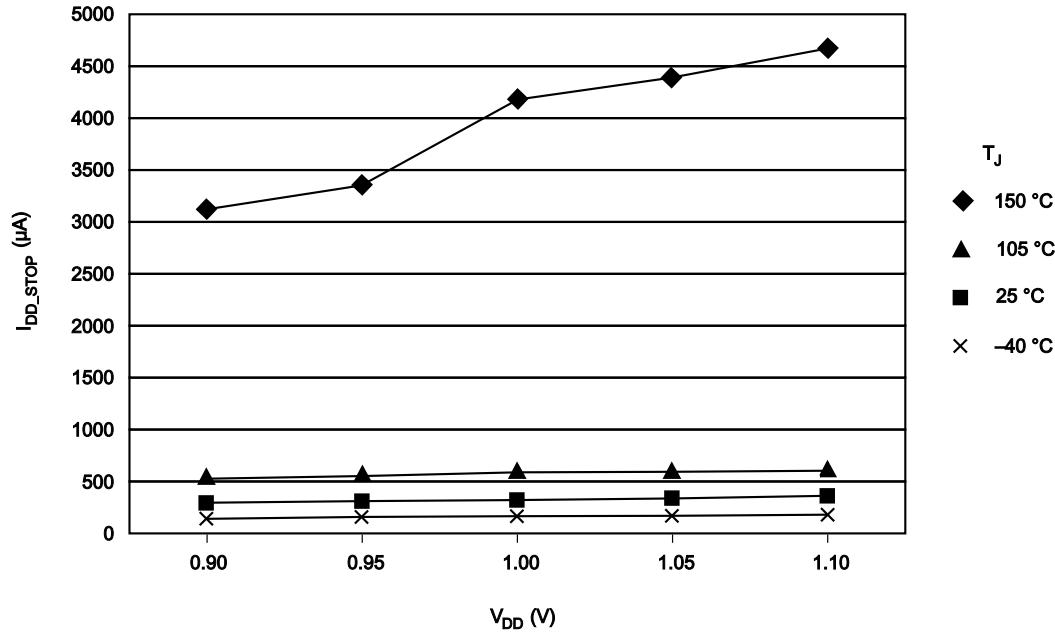

### 8.8.1 Example 1

This is an example of an operating behavior that includes a typical value:

Symbol	Description	Min.	Typ.	Max.	Unit
I <sub>WP</sub>	Digital I/O weak pullup/pulldown current	10	70	130	μA

### 8.8.2 Example 2

This is an example of a chart that shows typical values for various voltage and temperature conditions:

## 8.9 Typical value conditions

Typical values assume you meet the following conditions (or other conditions as specified):

**Table 24. Typical value conditions**

Symbol	Description	Value	Unit
T <sub>A</sub>	Ambient temperature	25	°C
V <sub>DD</sub>	3.3 V supply voltage	3.3	V
